

iOS Development: Multiple MVC's and Storyboards

Jamie Edge

Learning Goals

- Understand the meaning of the following components:
 - UITabBarController
 - UINavigationController
 - UIPageViewController
- Learn what a segue is, what types exist and how they can be defined and used
- Learn how these components can be linked in a Storyboard
- Understand how multiple MVC's can interact with each other

Advantages of UITabBarController

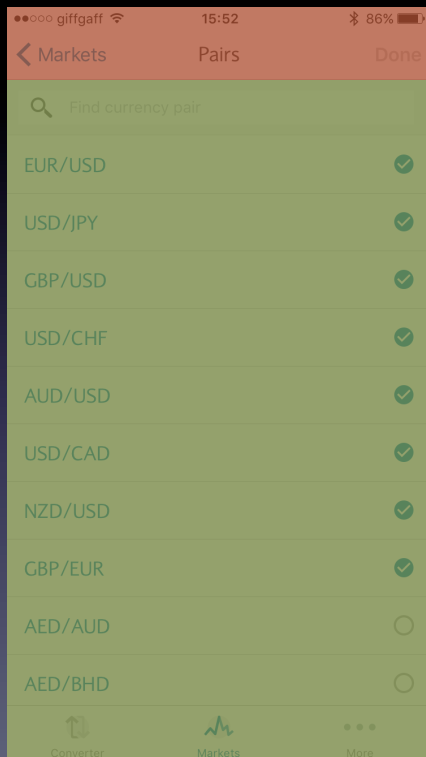

- Allows to present multiple view controllers that may not be linked
- Easy for the user to navigate from any screen

UINavigationController

Advantages of UINavigationController

- Allows functionality for common user journeys

Advantages of UINavigationController

- Reuse the same detail view controller
- Choice of transition types
- Can be used to create swipe-through tutorials

Segues

'Show' (Push)

- Usually used with a UINavigationController
- Pushes a view into the navigation stack
- Can reverse the segue by using 'Back' action

'Present Modally' (Modal)

- Used to present a view controller over the existing content
- Usually slides in from the bottom
- Can dismiss by using
'dismissViewControllerAnimated' method

Other Segue Types

- 'Show Detail' (Replace)
 - Used with UISplitViewController
 - Example: Landscape Mail on iPad when selecting a message
- 'Popover Presentation' (Popover)
 - Displays view as a popup
 - Example: Pressing 'About' on FX powered by Barclays on iPad
- Custom
 - Use delegate methods to define a custom presentation

UINavigationController and Segues

Multiple Model View Controllers (MVC's)

Why do MVC's need to communicate?

- Exchange information entered by the user
(e.g. a name entered into a text field)

Getting a reference to another View Controller

- Use a weak property
- Creating the class ourselves – provide a direct reference
- Using a segue – get the presented view controller reference within 'prepareForSegue'

Practical Example

Multiple MVC's

Programmatic Approach for UITabBarController
and UINavigationController

Task 1

Using the 'Single View Application' template, create an app that uses both UITabBarController and UINavigationController. Use both 'Show' and 'Present Modally' segues.

Task 2

Using your application from Task 1, pass data between two different View Controllers using 'prepareForSegue'.

Task 3 (Optional)

Create an app using the 'Page-Based Application' template, and modify it to use a dictionary data source. Each page should display a title and content section.
